HW 1: SIR and SEIR Model Implementation for Pandemic Spread

Hypothesis
I expected a day 40-45 SIR peak of 450-500 cases, repeated SEIR waves, and a stronger peak effect from β.

Partly supported
SIR timing and size: supported.
Multiple SEIR waves: supported.
β > γ sensitivity: not supported.

Key Number
469 infectious people
SIR peak on day 42.5

Modeling lesson
Mechanistic intuition alone can be misleading; comparing β and γ at the same R_0 reveals how each parameter differently affects the infection peak.
